

BIOBASED STAR FILM

The innovative film for a new sustainable packaging

Committed to producing **safe and cost-effective** packaging materials to offer an adequate food preservation in the most **sustainable** ways, *Fabbri Group* is proud to present **BIOBASED STAR FILM**, the PVC stretch film mostly derived from **renewable raw materials** of plant origin instead of fossil ones. **BIOBASED STAR FILM** is a “**drop-in**” solution for current users, as it provides an immediate advantage in terms of **sustainability balance**, adding **no additional costs or investments** to packers, consumers or end-users, while maintaining the **same performance levels as standard PVC** stretch films

Being an added value for consumers, its **OK-biobased conformity mark** released by *TÜV Austria* can become thus an additional marketing tool for retailers.

BIOBASED STAR FILM is a “**fit for use**” material, as its specific widths and features can be chosen **according to the client’s application**, allowing, when possible, to further **reduce packaging material usage**.

It is the only film of this kind available on the market and can be used either **manually** or on **automatic** packaging equipment: its special combination with *Fabbri Group’s* wrappers of the *Elixa* and *Automac* lines further allows to save on material consumptions due to their **exclusive stretching systems**.

As a monomaterial, **BIOBASED STAR FILM** is **fully recyclable** and - no need to say - it is compliant with **all EU regulations** in force, especially those on food contact materials.

Try **BIOBASED STAR FILM** also in its **printed** version (up to **10 colors** with **digital clichés**) and give your products an **additional promotional touch!**

Our Film Designers are at your disposal.
